- Hotels
- Completion: 2017

Uponor involvement

• Project Highlights

- 1,100-foot tall, 73-story, 2.1-million-square-foot commercial building
- Largest continuous concrete pour in the world
- Used 100,000 ft. of Uponor PEX tubing for a concrete thermal cooling system to keep an even temperature in the slab as it cured, preventing cracking

• Benefits of using Uponor PEX for concrete thermal cooling

- Lighter weight of PEX made it easier to move around the job site
- Extreme flexibility of PEX made it fast and easy to install around the rebar in the base of the structure
- Any kinks in the pipe were easily repaired (which can only be done with PEX-a tubing), eliminating the need to add couplings in the slab
