

Uponor

Build on Uponor with Base Flexiboard

230 V room controller with fast channel selector switch

NEW

- ✓ Flexible allocation of one or more actuators to the room thermostats via selector switch during or after installation
- ✓ Pre-wiring without terminal diagram
- ✓ Save time during installation and commissioning

Significantly less effort thanks to Uponor Base Flexiboard

No more need for re-wiring on site, no terminal diagram required

Uponor Base Flexiboard is a 230 V control that enables individual room control for 6 or 8 rooms. There are also 2 variants with integrated pump logic available. This switches the circulating pump on or off as required and enables an energy-efficient operation.

The Uponor Base Flexiboard control distributor, in combination with prefabricated distribution stations, makes work much easier.

Convenient allocation of the actuators to the room thermostats via a selector switch. This means there is no more need for re-wiring on site. The allocated actuators can be changed later on without difficulty. Multiple actuators can also be allocated to one room thermostat.

The use of Uponor Base Flexiboard in the prefabricated distribution station eliminates the need for a terminal diagram. This saves the installer time, because he can perform the allocation conveniently in a matter of seconds using the selector switches and can also change it at will without any effort.

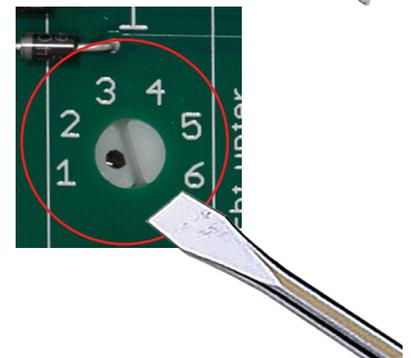

- For connection of 6 or 8 room thermostats and up to 12 actuators
- Individual allocation of the actuators to the room thermostats via a selector switch
- Allocation of more than one actuator to a single room thermostat
- No need for a terminal diagram or for on-site re-wiring
- Time saving in installation and commissioning
- Suitable for conventional 230 V thermostats
- Version with pump connection and pump logic available

Flexiboard enables pre-wiring without a terminal diagram in prefabricated distribution stations

Easy to change actuator allocation at any time
