**Comprehensive solutions
for stormwater management**

➤ Pre-treatment

➤ Retention

separator
integrated with
a settling tank

Smart tanks are a comprehensive and compatible stormwater management system with monitoring and control functions. Their task is to pre-treat, retain and reuse stormwater. Depending on the equipment we use, stormwater will be managed in an appropriate way. They can be used for watering greenery, washing streets and squares, flushing toilets or infiltrating part of retained water into the ground. Drainage of stormwater from tanks can be carried out gravitationally or with the use of properly selected, integrated pumping systems.

watering greenery

washing streets and squares

recreation purposes

fire-fighting purposes

flushing toilets

infiltrating into the ground

➤ Storm water management

Benefits of using smart tanks:

- flooding prevention
- ecological measures - using stormwater or retaining it at the source
- economic measures - reducing the costs of discharging water to the sewage system, reducing the costs of maintaining urban greenery, playing fields, roads, minimizing the consumption of potable water and minimizing the costs of stormwater charges
- the possibility of using the area above the tank (installation in green area and loaded with wheel traffic)
- selection and warranty of one manufacturer with the possibility of servicing built-in devices
- rational impact on the amount of financing from the European Funds
